# Native Grass Mix

***65% Buffalograss***  
***20% Native Blue Grama***  
***15% Perennial Ryegrass Blend***

**Native Grass Mix** is specifically designed for those consumers who want a completely drought-tolerant, disease-free lawn after establishment. This mixture may also be used for pasture, range and soil stabilization on south facing slopes in altitudes up to 6,000 feet.

Endophyte free grasses provide good grazing. Additionally, animals would have a hard time grubbing these grasses out because of the low crown heights. Recommended sowing times: May, June and early July. This mixture will be slow to germinate and must be kept moist until the seeded area is completely established. These grasses are low growing, blue-green to medium-green in color, with a fine leaf texture but coarse feeling to bare feet. Buffalograss and Native Blue Gramas are particularly slow growing, which eliminates the need for weekly mowing. **Not recommended for shaded areas.**

**Sow rate: 3-5 pounds per 1,000 sq. ft.**
