PV Forage Barley

PV Forage Barley is a 2-row, white-grained spring barley. It was bred for haymaking and is an excellent choice for fodder growers.

PV Forage Barley is both high in protein and fiber in its grass form (refers to the barley plant in its young stage, still a dark green, leafy plant. In this form, barley is similar in taste, appearance and nutrients to leafy green vegetables, rather than a grain).

PV Forage Barley has a high hay yield and is adapted to dryland and irrigated areas. Protein averages around 9.8%.

Seeding rate:

Irrigated 100 lbs per acre

Dryland 50 lbs per acre
